

SUMMARY OF
SEASONAL OCCURRENCES
of
LOUISIANA BIRDS

by
GEORGE H. LOWERY, JR.

Reprinted for the
LOUISIANA ORNITHOLOGICAL SOCIETY
from the Third, Revised Edition of the book LOUISIANA BIRDS
published by
Louisiana State University Press, 1974

SUMMARY OF SEASONAL OCCURRENCES

IN PREPARING the following charts (Table 3), I have attempted to show in condensed form the seasons or periods of occurrence and the approximate relative abundance of the 411 species of birds that are known to have occurred in Louisiana. Although this graphic presentation provides a quick reference to many useful data, it cannot portray all the facts that may be desired. I have made no attempt to indicate the fine degrees of abundance among the various species. The top category, "common to abundant, at least locally," includes many shades of commonness. It includes not only the Red-winged Blackbird, which sometimes blackens the rice fields, but also the Belted Kingfisher, which is widespread and conspicuous along our bayous and streams but which is seldom seen by a single observer in numbers of more than a dozen in the course of a day. Variations in the relative abundance of a bird in its different habitats and variations in a bird's abundance in different parts of the state are often very great. Although the Seaside Sparrow, for example, is entirely absent in all the inland parishes of the state, it is abundant in its one habitat, the salt marshes of the coast. I have, therefore, designated it as "common." Neither can the charts tell much about the year-to-year fluctuations in the numbers of a given species. The Red-breasted Nuthatch inundated the state in 1940, and to a lesser extent in 1941, in numbers that would have placed it high in the top category. Yet it has been all but absent in some years since the big invasion. Consequently, I have felt obliged to class it with the "very rare or irregular" species.

In a further attempt to overcome some of these difficulties, I have shown the status of each bird in the state as a whole (top line by each

species), as well as its status in the Baton Rouge area (second line), which is interpreted here to include East and West Baton Rouge, East and West Feliciana, Pointe Coupee, Iberville, and Ascension parishes. The Baton Rouge area may not be regarded as truly indicative of the situation with respect to all inland localities, but at least it is noncoastal. Moreover, the Baton Rouge area happens to be one of the few areas in the interior of the state where there has been fairly complete coverage over a long number of years. An ideal arrangement, of course, would have been to have had four lines for each species: one for a strictly coastal locality, one for an area in the central-southern part of the state, one for an area in northern Louisiana, and, finally, a line summarizing the data for the state as a whole.

The numbers on the charts are the extreme dates of arrival and departure based on carefully sifted records in the literature or on file in the LSU Museum of Zoology. They cover the period from the time of Audubon to March 1, 1974. Birds definitely known to breed in the state are indicated by a star after the name. Proof of breeding in the state is based on the discovery of an actual nest with eggs or with young, but the detection of juveniles barely capable of flight is also considered sufficient. In the case of several species such unimpeachable evidence of breeding in Louisiana is still lacking, although the birds in question almost surely do so.

Observations that extend any of the migration dates or the seasons of occurrence, as well as any new information relating to the birds of Louisiana, should be transmitted along with full particulars to the LSU Museum of Zoology in order that the new facts may be put on file for future use by anyone who is interested. This does not mean to imply that every sight record of a bird that comes into the museum is automatically accepted and used. Sight records of birds are particularly subject to error, even when made by the most competent ornithologist. Consequently, to be of value they should invariably be accompanied by full supporting details. Scientific data of any sort must always be subject to the closest scrutiny and to the most rigid tests of their validity. Science is truth. When we seek the truth, we must always demand unimpeachable evidence.

Table 3 Charts Showing the Seasonal Occurrence of Louisiana Birds

	Common to abundant, at least locally.	Very rare or irregular; not found every week or even every month during its season, sometimes skipping a year or more, but when present possibly locally common for a short period.
	Uncommon or only moderately common, but found regularly in smaller numbers.	★	Breeding known.
	Rare; found infrequently, not every day, but to be expected, particularly at certain times of the year.		

Note: The first line by each species shows the status of the bird in the state as a whole; the second line shows the status in the Baton Rouge area as geographically defined on page 596. One species, the Purple Sandpiper, was recorded for the first time in Louisiana too late to be included in the charts (see page 315).
